Introduction

Introduction – short summary

- location of activation
 - motor areas
- activation crucial?
 - possible; seems to be crucial
- time course?
 - about 170-200 ms after word onset

Introduction - relevant research

- focus on reaction time
- semantic processing seems important (Sato et al., 2008; Mirabella et al., 2012)
- different findings
 - interference effect (Boulenger et al., 2008)
 - facilitation effect (Scorolli & Borghi, 2007)

Introduction – relevant research

- timing: 400 ms
- task
 - no reaction to the prime verb
 - hand and foot reactions in one task required
- modulation of
 - imageability (ImgbI.)
 - movement energy (MovEn.)

Introduction - design/hypotheses

- motor priming paradigm applied
- hypotheses

main effect response

hand reactions faster than foot reactions

main effect imageability

high level elicits faster reactions

main effect movement energy

high level elicits faster reactions

interaction verb*response

interference/facilitation

Methods - participants

- 21 healthy subjects (10 male, mean age = 21.3, SD = 1.2)
 - monolingual German native speakers
 - right-handedness and right-footedness confirmed

Methods - verbs

- stimulus set: 96 action verbs (48 hand verbs + 48 foot verbs) + 12 non-body verbs

Imgbl.	high		low	
MovEn	high	low	high	low
Hand verbs Foot verbs	boxen, kneifen eilen, rennen	angeln, binden gehen, stehen	kehren, rütteln hasten, rasen	fassen, tippen hoppeln, trotten
	hi_hi	hi_lo	lo_hi	lo_lo

- non-body verbs
 - ähneln, grübeln, wundern, wünschen...

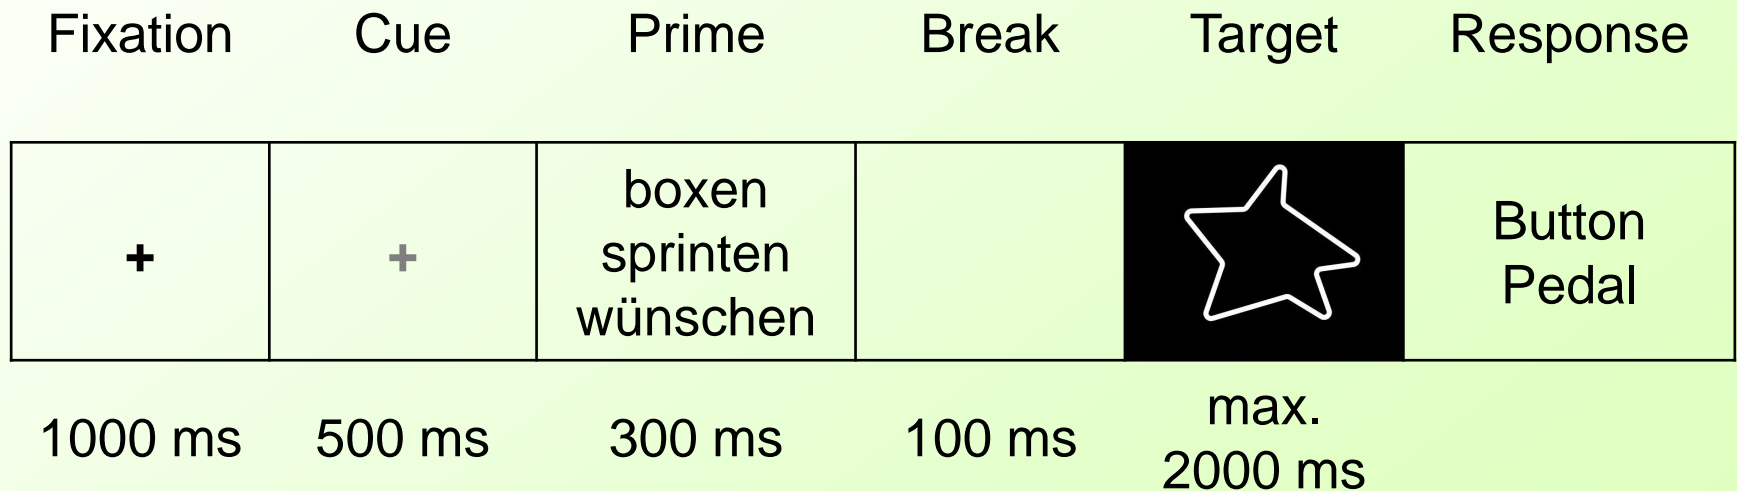

Methods - shapes

- shape decision task
 - 12 pointed shapes, 12 rounded shapes
- hand reactions: space-key
- foot reactions: foot pedal

Methods - procedure

- 6 practice trials
- 6 blocks à 72 trials (432 trials)

Methods - statistical design

- repeated measures ANOVA

- factors
 - imageability (2: high, low)
 - movement energy (2: high, low)
 - response (2: hand, foot)
 - verb (2: hand, foot)

Results

factor	per-subject analysis	per-item analysis
response	**	**
verb	n.s.	n.s.
Imgbl.	$p = .072$	n.s.
MovEn.	n.s.	n.s.
verb*response	n.s.	*
verb*response*MovEn.	*	*

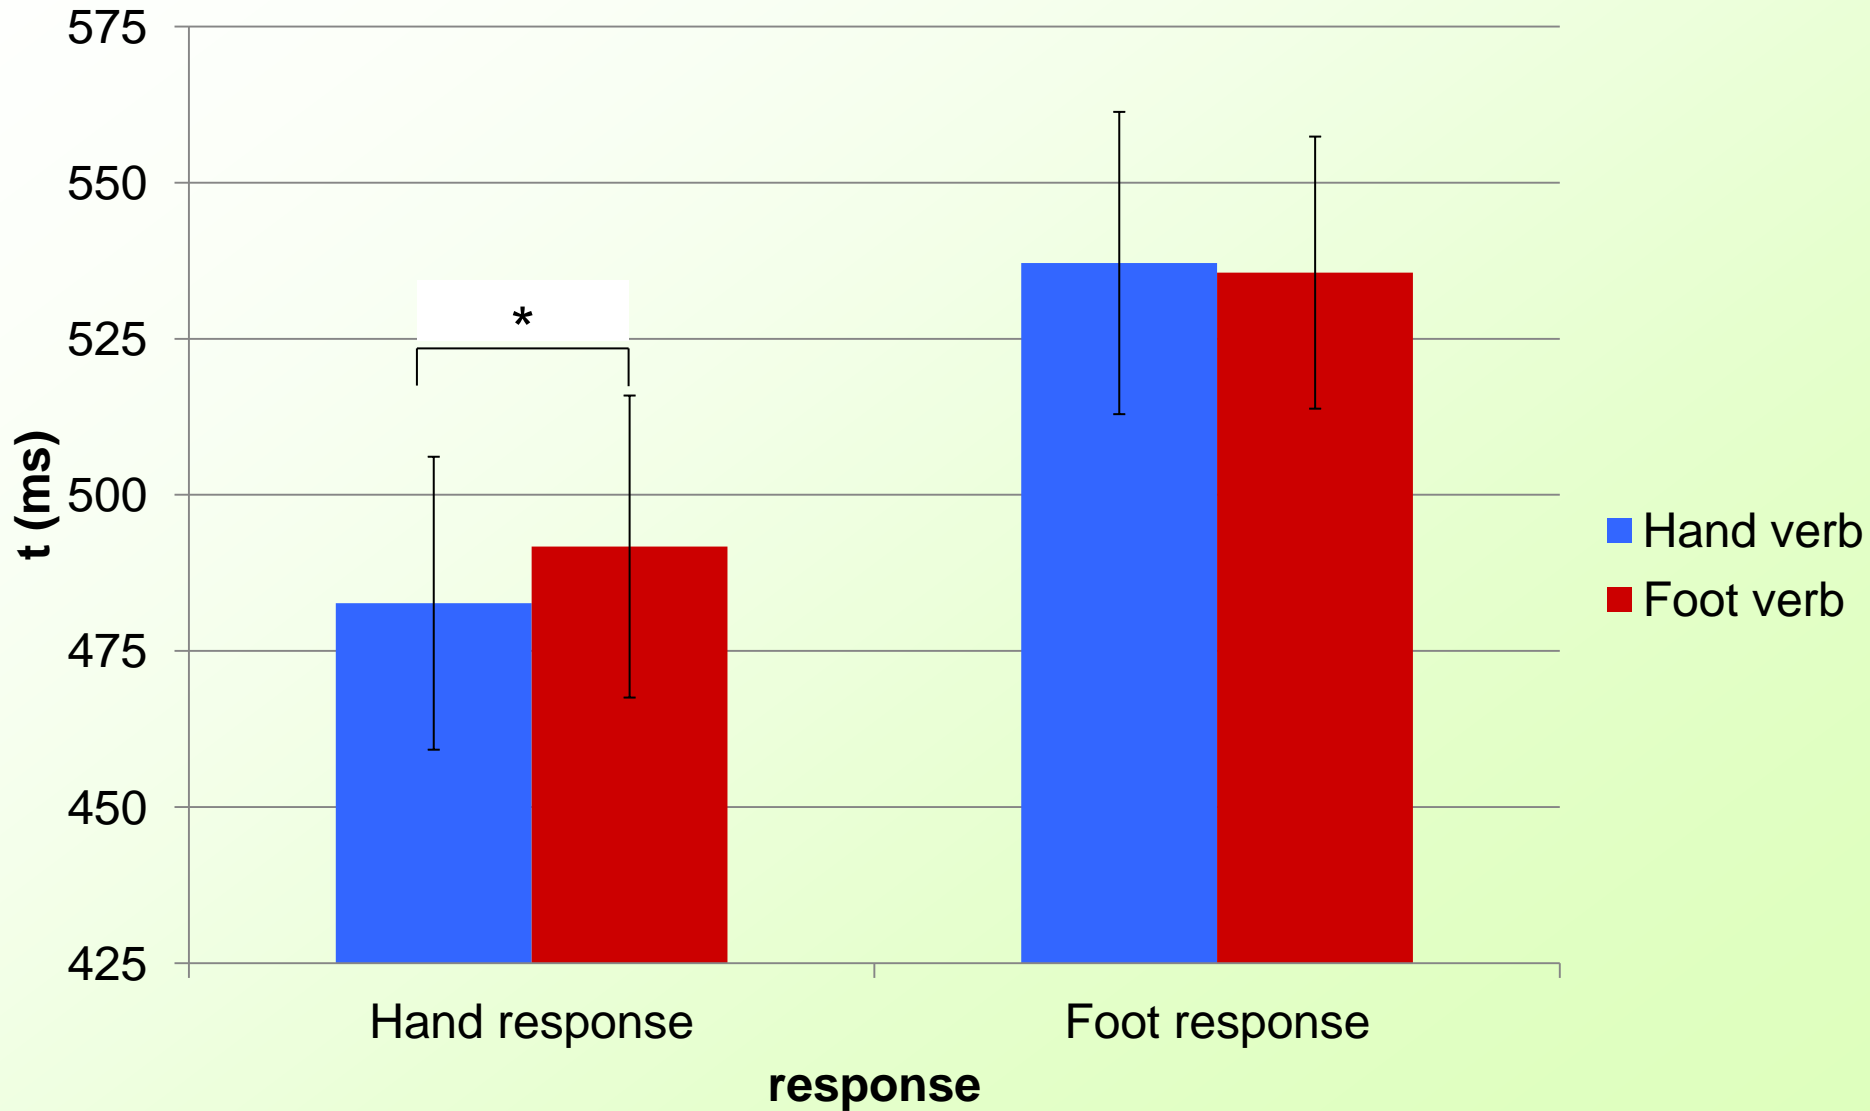

* $p \leq .05$

** $p \leq .001$

Results – main effect response

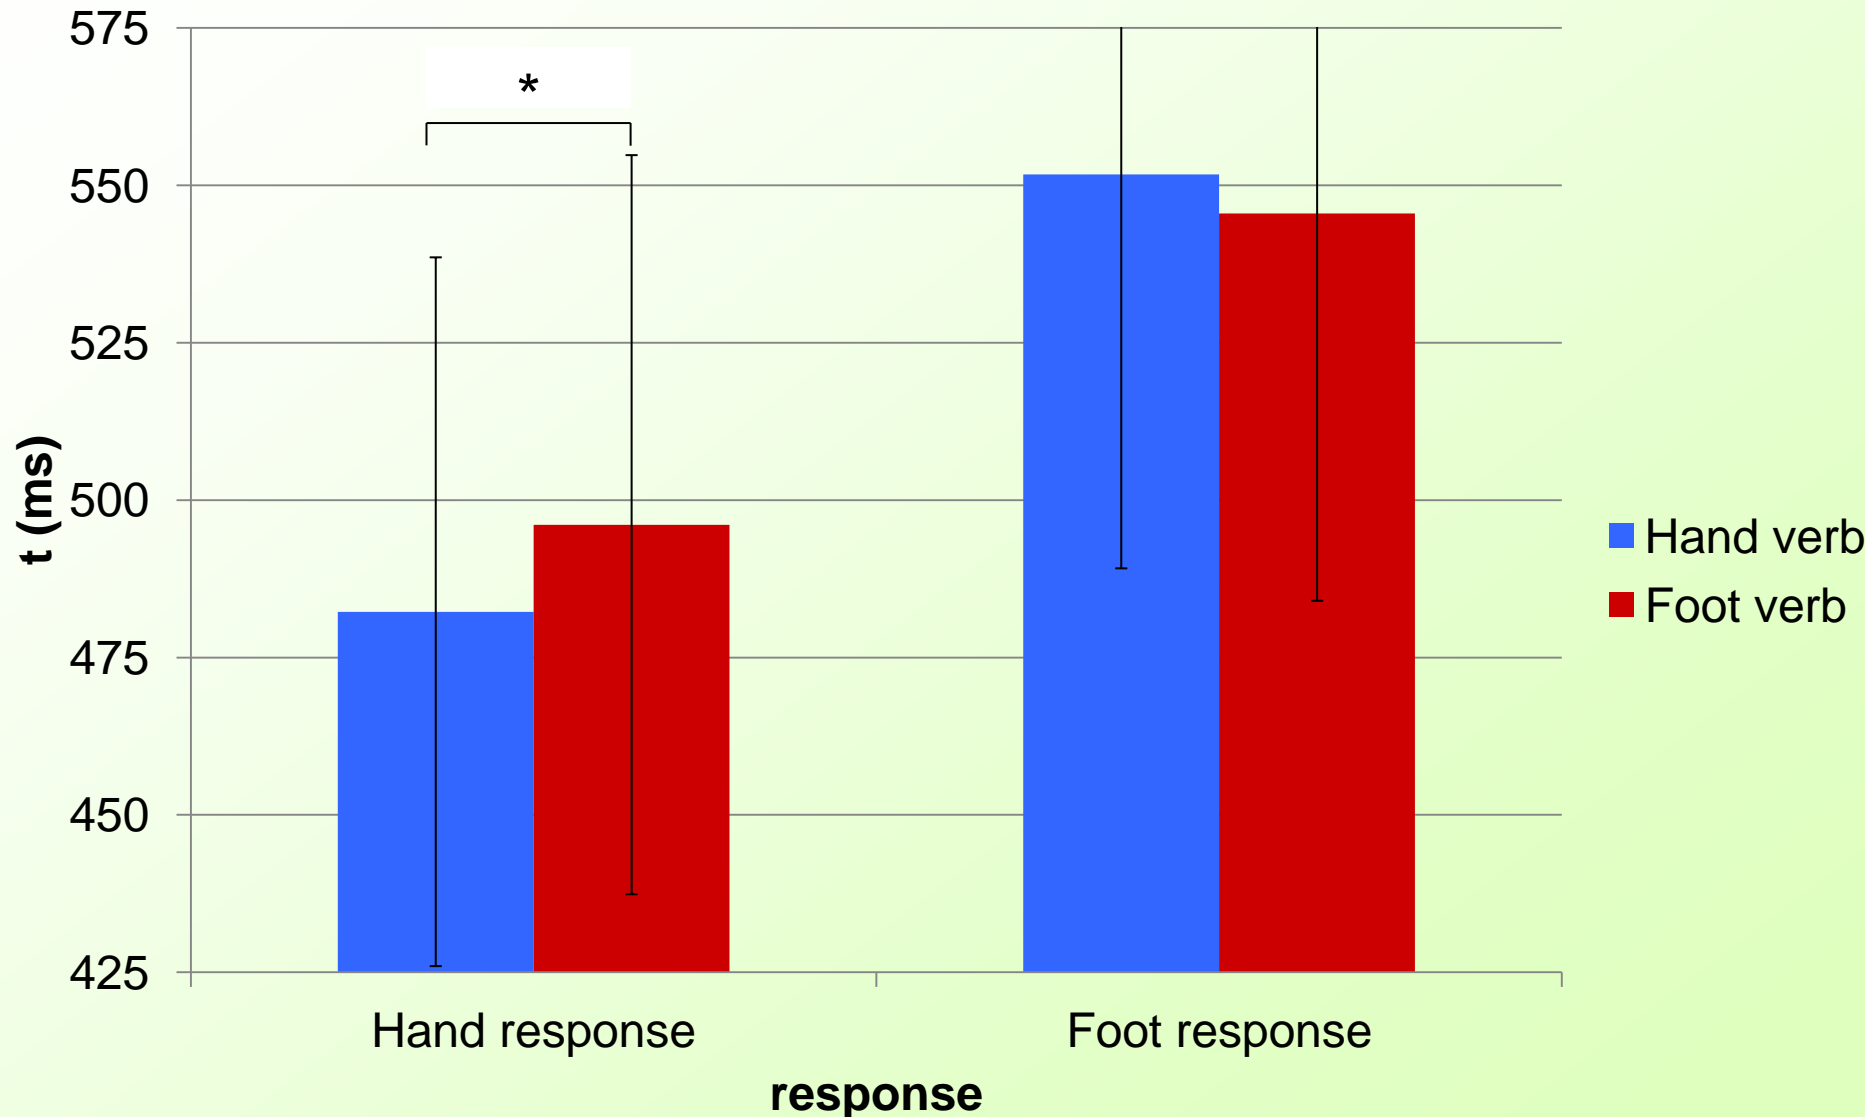

Results – interaction verb*response

Results – interaction verb*response*MovEn.

Results – interaction verb*response*MovEn.

Discussion

- no main effect Imgbl./MovEn.
 - no reaction to verb required
- interaction verb*response*MovEn.
 - facilitation effect
 - results support grounded cognition (Barsalou, 2008)

Future research

- semantic factors influence response times
- EEG/MEG
- timing
 - shorter time span
 - masked prime
- task
 - same design
 - reaction only following an action verb

Future research – Work in progress

The end.

Thank you for your kind attention!
