A Comparative Approach on the Faculty of Syntax: Towards an Operative Definition of Language

Are nonhuman animals rational?

How did language evolve?

Are humans the only “linguistic” species?

What is language?

Methodology of inquiry

A. Focus on a core constitutive trait of the ability of language:

“Syntax”

meaning from the greek ***“syntaxein”***:

connect different elements according to structural rules.

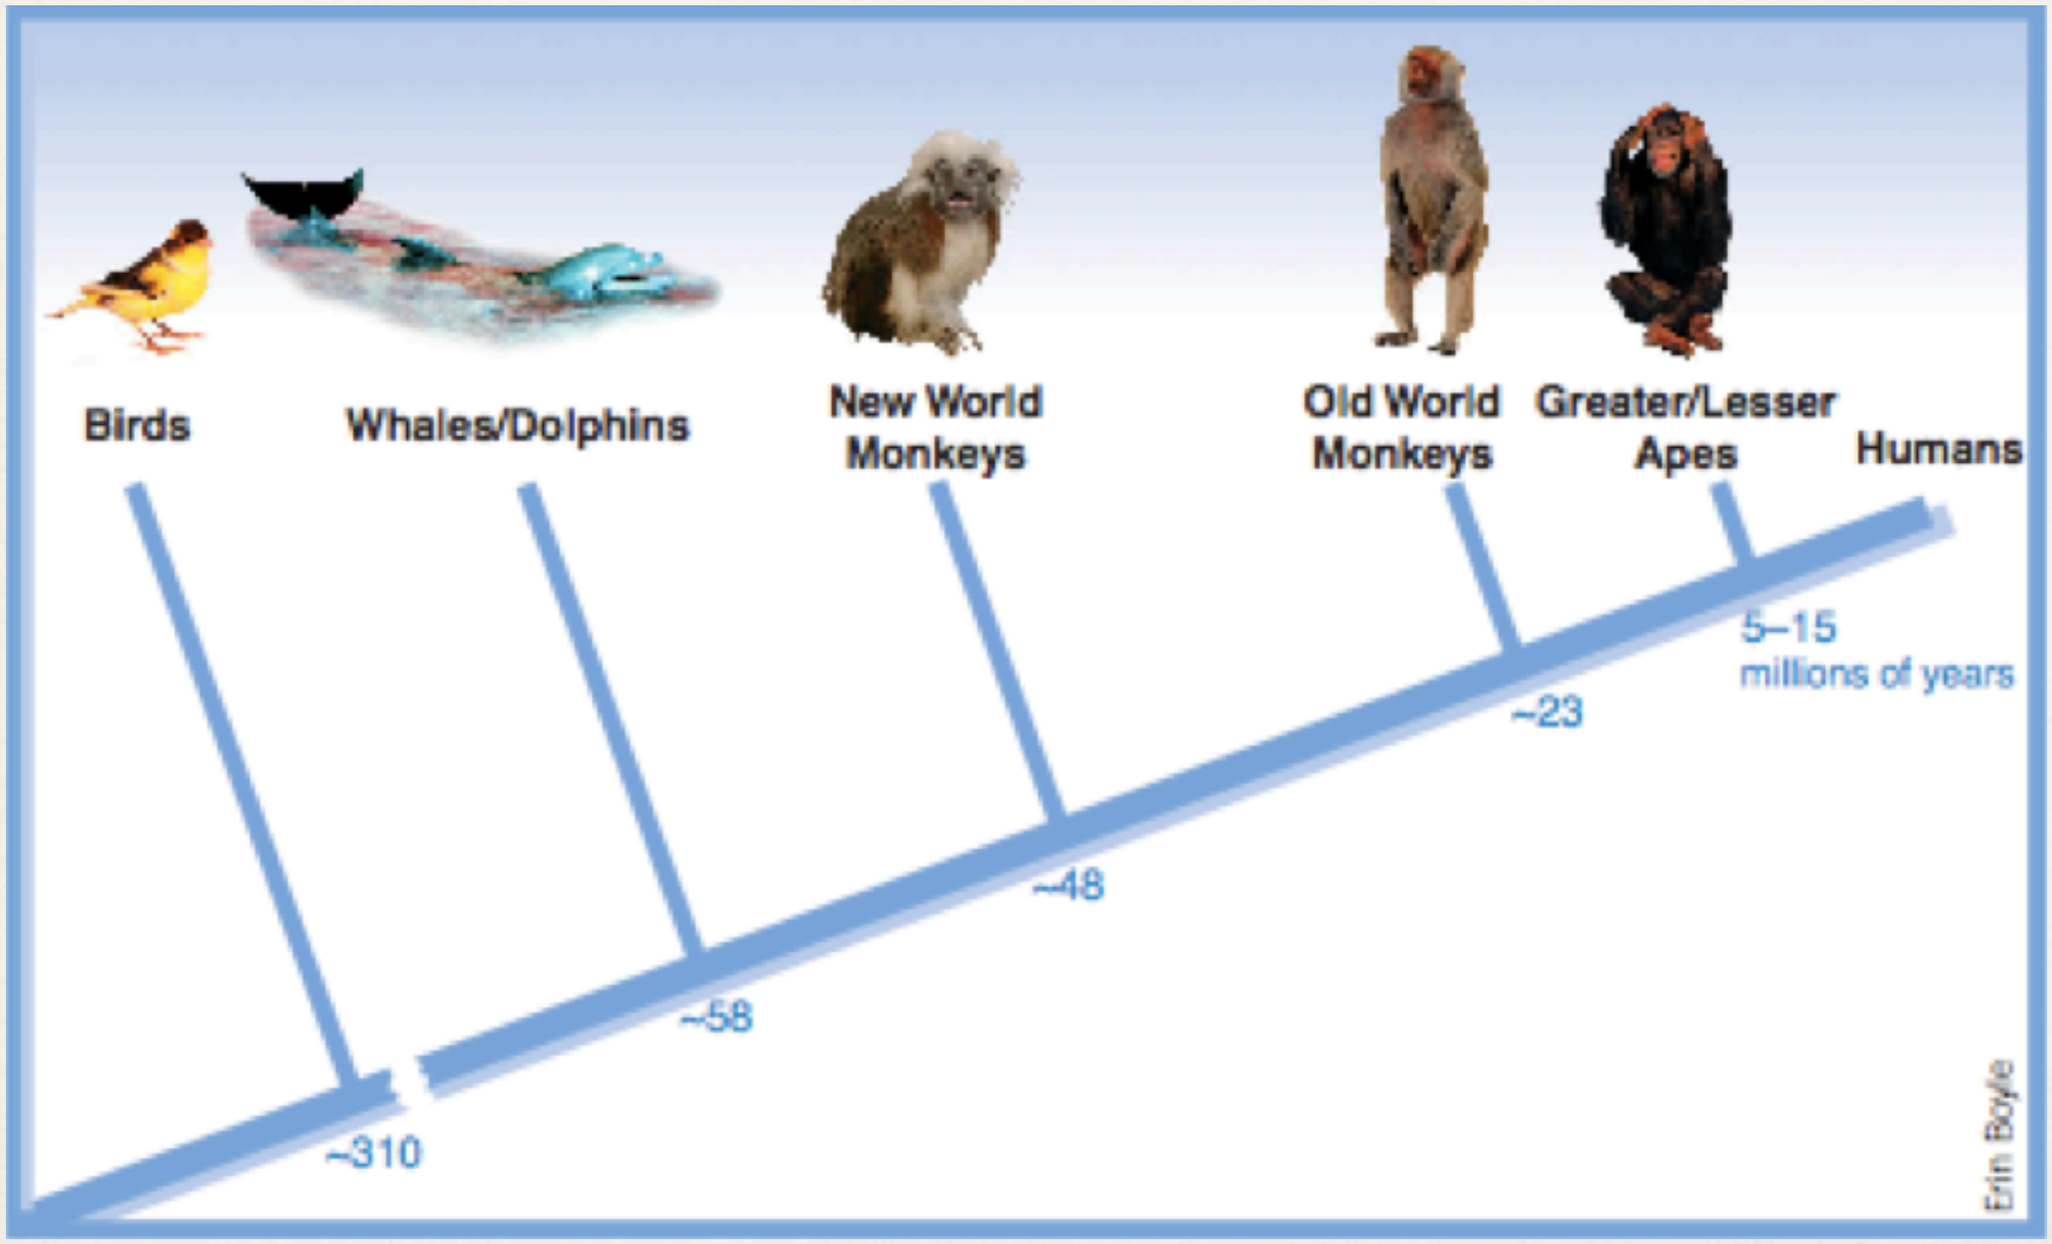
The faculty of language (broad sense)

B. Apply a comparative approach on the **phylogenetic evolution of** ~~language~~ **syntax**

→ core cognitive operations **shared among animal species**

→ **species-specific traits** of human language

The evolution of the ability to recognize syntactic structures



The faculty of language

Comparative approach
on the **phylogenetic evolution**
of ~~language~~ syntax

core cognitive operations
shared among animal species

species-specific traits of
human language

REVIEW: NEUROSCIENCE

The Faculty of Language: What Is It, Who Has It, and How Did It Evolve?

Marc D. Hauser,[1]* Noam Chomsky,[2] W. Tecumseh Fitch[1]

We hypothesize that FLN [faculty of language narrow sense] only includes **recursion** and is the only uniquely human component of the faculty of language.

Recursion

strings are embedded within other strings of the same kind, creating complex **hierarchical structures** and **long-distance dependencies**.

Do animals have the ability to process recursive structures?

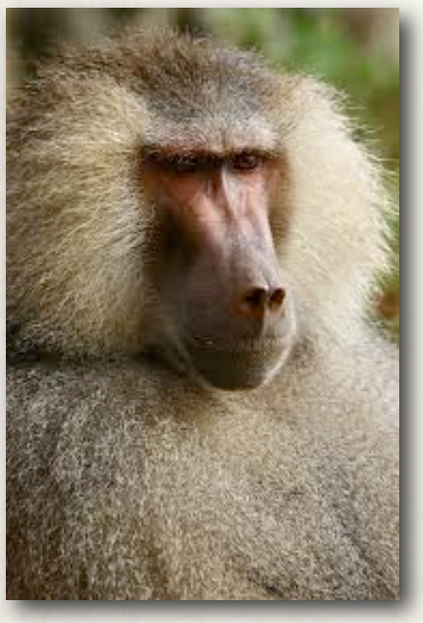
Brief article

Centre-embedded structures are a by-product of associative learning and working memory constraints: Evidence from baboons (*Papio Papio*)

Arnaud Rey [a,*], Pierre Perruchet [b], Joël Fagot [a]

[a] *Laboratoire de Psychologie Cognitive – CNRS, Aix-Marseille Université, Marseille, France*
[b] *Laboratoire d'Etude de l'Apprentissage et du Développement – CNRS, Université de Bourgogne, Dijon, France*



2.2. Material

They were tested with learning devices equipped with a touch screen and a food dispenser. The main innovation of the test equipments is that the baboons participated at will, as they had a 24-h access to the computers from the outdoor enclosure, where they live in a social group (see Fagot & Bonté, 2010, for a detailed description of the testing apparatus). Twelve shapes (e.g. Δ, Φ, ϑ, Γ, Σ, Ω, ∗, ∋, ς, &, λ) were used to create six arbitrary pairs of stimuli, hereafter noted a_1b_1, a_2b_2, …, a_6b_6. A different set of 10 neutral shapes served as visual distractors ().

The faculty of language:
comparative studies on nonhuman species:

} Ability to process "perceptual syntax"

AB^n A^nB^n

Is the ability to process perceptual patterns
a pre-requisite for humans' faculty of language?

AB^n A^nB^n

Perceptual syntax

patterns in the perceptual domain

Propositional syntax

patterns ruled by logical, morphological connections

What's the difference?

- **recognizing** a language - **perceptual syntax**

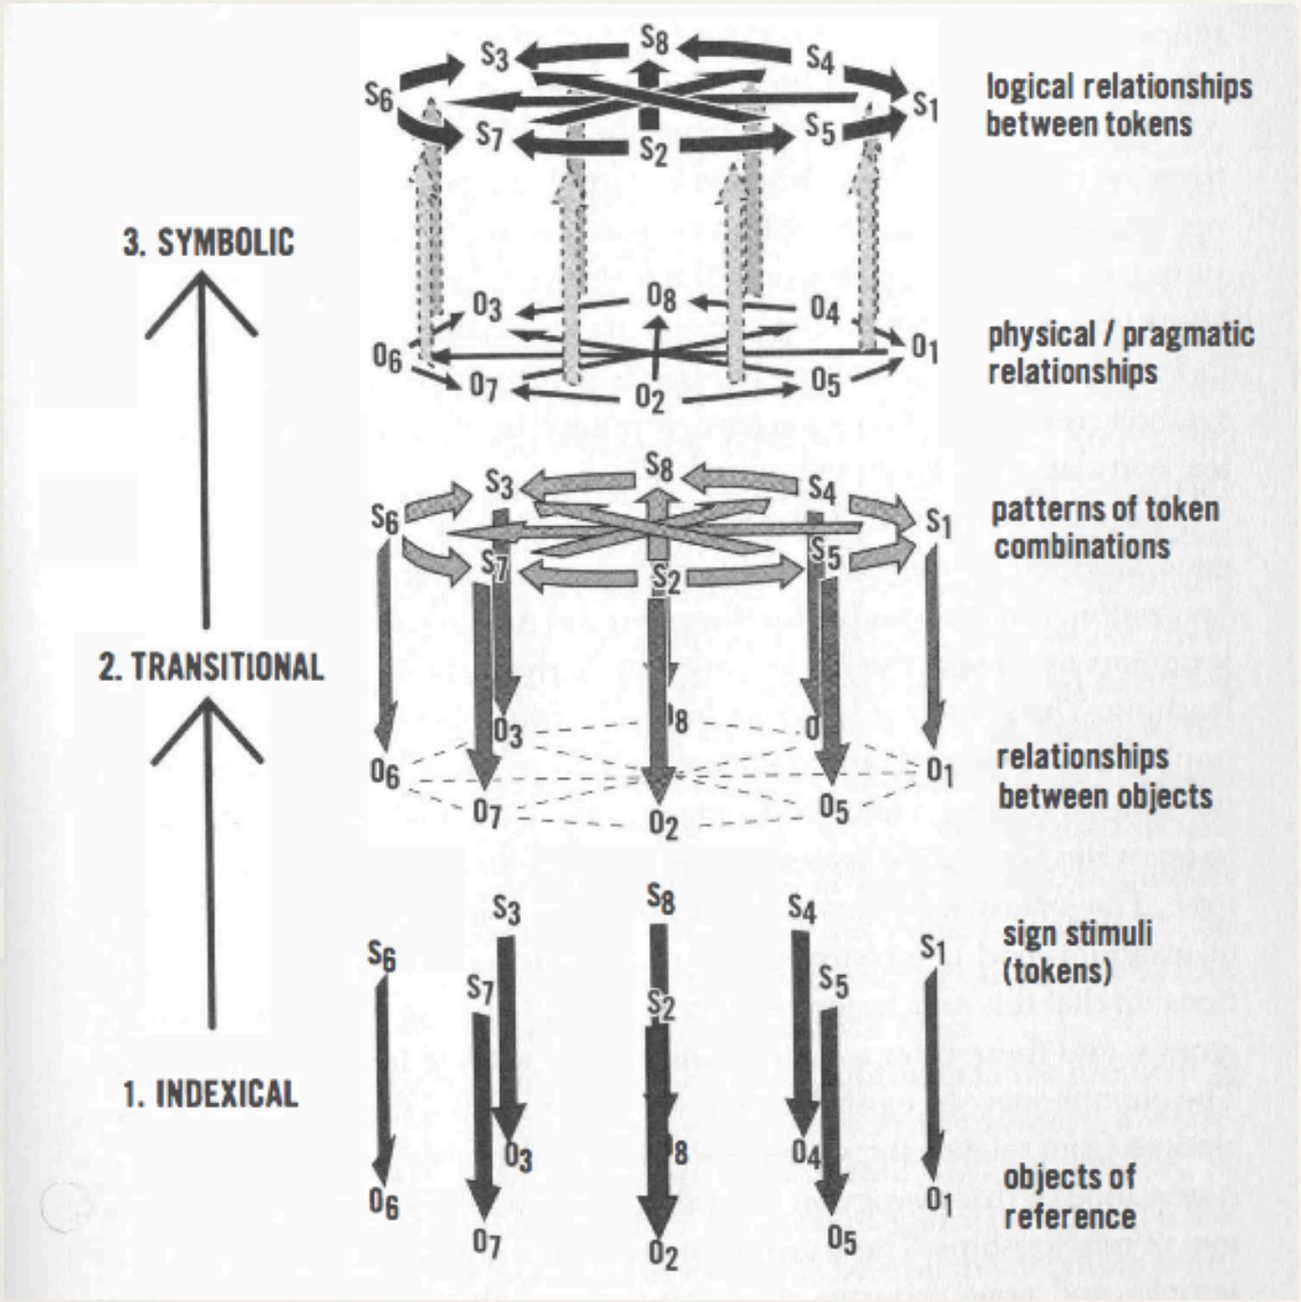
- **understanding** a **propositional syntax**

↓

1) elements that have internal logical dependencies

2) linked to external objects (existent or not): meanings

Uniquely human?



The **indexical power** is *distributed,* so to speak, in the relationships between words.

Symbolic reference derives from *combinatorial* possibilities and impossibilities [...].

Deacon T., *The Symbolic* Species, 1997

Hypothesis

Humans are the only species able to categorize the units of a pattern going beyond its perceptual characteristics:

- combine different elements within a network of combinatorial logical relationships

- link them to a referential state of affairs.

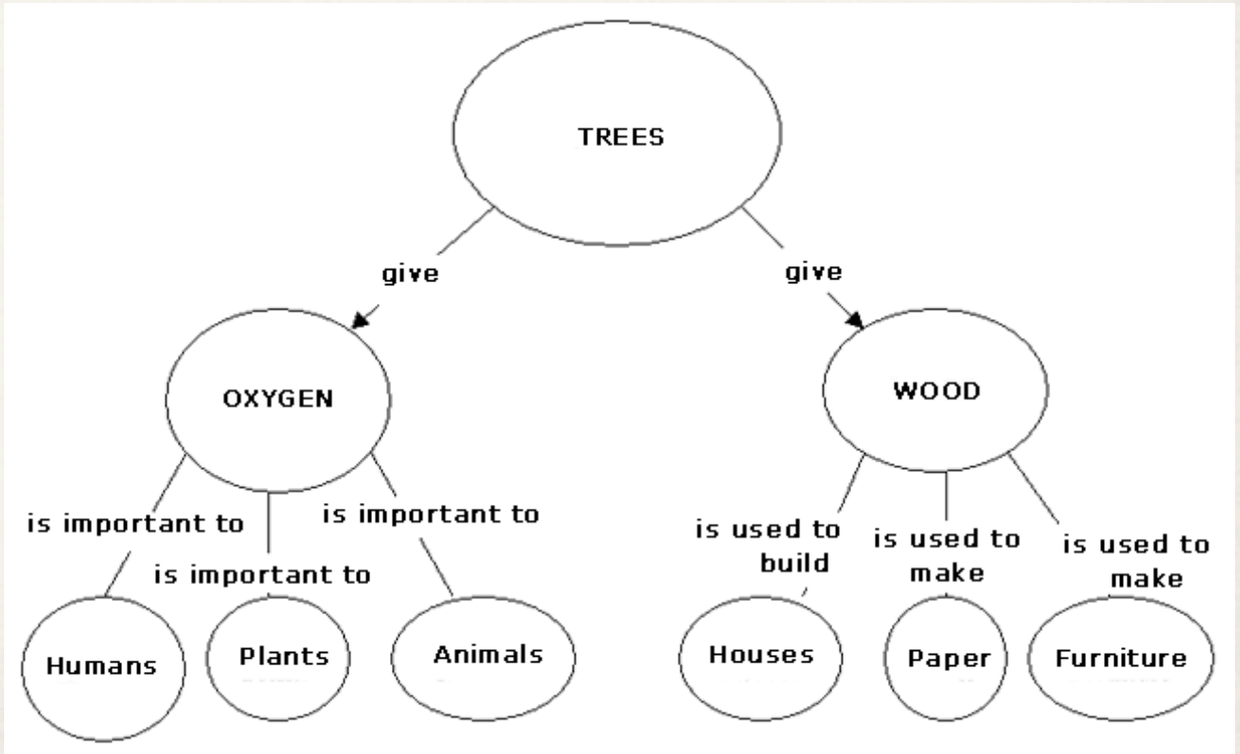
Humans can associate a combinatorial pattern to a structural combination among external objects or categories of objects.

compute mathematical expressions

$[(2+6) : 3] - 5 = \ldots$

draw conceptual maps

...



New suggested methodology for a comparative approach

Address the ability of nonhuman animals to

a) process simple perceptual patterns with internal dependencies between the elements

b) refer these basic structures to a pattern of external objects of reference

↓

what makes a species-typical human linguistic expression out of a pattern of perceptual stimuli
